

GRASP ACTIVITY

Consider the following domain model related to video store management system and identify the responsibility of each class accordingly.

1. Identify two different classes which you think best fit for **Information Expert and why?**

Class that has the necessary information to fulfill a responsibility.

CUSTOMER, MEMBERSHIP, VIDEO, VIDEO DESCRIPTION, SHELF.....

2. Identify two different classes which you think best fit for **Creator and why?**

Class that creates instances of another class it closely uses or aggregates.

STORE AND RENTAL....

3. Identify class which you think best fit for **Controller and why?**

Handles system operations; acts as an intermediary between UI and domain layer.

VIDEO STORE.....

4. Identify two different classes in which you think **coupling should be low and why?**

Minimize dependencies among classes.

VIDEO DESCRIPTION AND VIDEO SUPPLIER.....

5. Identify two different classes, which you think **cohesion should be high and why?**

Class focuses on a single purpose or closely related set of tasks.

CUSTOMER, STORE, VIDEO

6. Identify any class, which needs to be added as a **pure fabricated class and why?**

Artificial (non-domain) class added to achieve low coupling/high cohesion.

TRANSACTION

7. Identify any case where polymorphism have precedence over alternative conditional statements?

Behavior varies by class type; decisions based on type are replaced by polymorphic operations.

PAYMENT AND PRICING POLICY

8. Identify two different classes in which **protected variants or hiding** is necessary?

Design isolates points of predicted change.

PRICING POLICY

9. Give any **indirection class**, which you needs to add as an adapter class in your domain model?

Intermediate object mediates between others to decouple them.
