

Data Structures

10. Linked Lists

Roadmap

- List as an ADT
- An array-based implementation of lists
- Introduction to linked lists
- A pointer-based implementation in C++
- Variations of linked lists

Linked List Using Pointers-Based Implementation of Lists

Linked List

- Linked list nodes composed of two parts
 - Data part
 - Stores an element of the list
 - Next part
 - Stores link/pointer to next element
 - Stores Null value, when no next element

Simple Linked List Class (1)

- We use two classes: **Node** and **List**
- Declare **Node** class for the nodes
 - data: double-type data in this example
 - next: a pointer to the next node in the list

```
class Node {  
    public:  
        double    data;    // data  
        Node*     next;    // pointer to next  
};
```

Simple Linked List Class (2)

- Declare **List**, which contains
 - head: a pointer to the first node in the list
 - Since the **list is empty** initially, **head** is set to **NULL**

```
class List {  
    public:  
        List(void) { head = NULL; } // constructor  
        ~List(void);                // destructor  
  
        bool IsEmpty() { return head == NULL; }  
        Node* InsertNode(int index, double x);  
        int FindNode(double x);  
        int DeleteNode(double x);  
        void DisplayList(void);  
    private:  
        Node* head;  
};
```

Simple Linked List Class (3)

Operations of List

- `IsEmpty`: determine whether or not the list is empty
- `InsertNode`: insert a new node at a particular position
- `FindNode`: find a node with a given value
- `DeleteNode`: delete a node with a given value
- `DisplayList`: print all the nodes in the list

Inserting a New Node

- **Node* InsertNode(int index, double x)**
 - Insert a node with data equal to x after the index elements
 - If the insertion is successful
 - Return the inserted node
 - Otherwise, return NULL
 - If index is < 0 or $>$ length of the list, the insertion will fail
- **Steps**
 1. Locate the element at the index position
 2. Allocate memory for the new node, copy data into node
 3. Point the new node to its successor (next node)
 4. Point the new node's predecessor (preceding node) to the new node

Insertion After The Last Element (1)

- Suppose `last` points to the last element of the list
 - We can add a new last item `x` by doing this

```
last->next = new Node();  
last = last->next;  
last->data = x;  
last->next = null;
```

Steps

- Locate the index element
- Allocate memory for the new node
- Copy data into node
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

Insertion After The Last Element (2)

- Suppose `last` points to the last element of the list
 - We can add a new last item `x` by doing this

```
last->next = new Node();  
last = last->next;  
last->data = x;  
last->next = null;
```

Steps

- Locate the index element
- Allocate memory for the new node
- Copy data into node
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

Insertion After The Last Element (3)

- Suppose `last` points to the last element of the list
 - We can add a new last item `x` by doing this

```
last->next = new Node();  
last = last->next;  
last->data = x;  
last->next = null;
```

Steps

- Locate the index element
- Allocate memory for the new node
- Copy data into node
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

Insertion After The Last Element (4)

- Suppose `last` points to the last element of the list
 - We can add a new last item `x` by doing this

```
last->next = new Node();  
last = last->next;  
last->data = x;  
last->next = null;
```

Steps

- Locate the index element
- Allocate memory for the new node
- **Copy data into node**
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

Insertion After The Last Element (4)

- Suppose `last` points to the last element of the list
 - We can add a new last item `x` by doing this

```
last->next = new Node();  
last = last->next;  
last->data = x;  
last->next = null;
```

Steps

- Locate the index element
- Allocate memory for the new node
- Copy data into node
- **Point the new node to its successor (next node)**
- Point the new node's predecessor (preceding node) to the new node

Insertion At The Middle (1)

- Suppose **current** points to the middle element of the list
 - We can add a new last item x by doing this

```
tmp = new Node();  
tmp->data= x;  
tmp->next = current->next;  
current->next = tmp;
```

Insertion At The Middle (1)

- Suppose `current` points to the middle element of the list
 - We can add a new last item `x` by doing this

Steps

- Locate the index element
- **Allocate memory for the new node**
- Copy data into node
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

```
tmp = new Node();  
tmp->data= x;  
tmp->next = current->next;  
current->next = tmp;
```

Insertion At The Middle (1)

- Suppose `current` points to the middle element of the list
 - We can add a new last item `x` by doing this

Steps

- Locate the index element
- Allocate memory for the new node
- Copy data into node
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

```
tmp = new Node();  
tmp->data = x;  
tmp->next = current->next;  
current->next = tmp;
```

Insertion At The Middle (1)

- Suppose `current` points to the middle element of the list
 - We can add a new last item `x` by doing this

Steps

- Locate the index element
- Allocate memory for the new node
- Copy data into node
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

```
tmp = new Node();  
tmp->data = x;  
tmp->next = current->next;  
current->next = tmp;
```

Insertion At The Middle (1)

- Suppose `current` points to the middle element of the list
 - We can add a new last item `x` by doing this

Steps

- Locate the index element
- Allocate memory for the new node
- Copy data into node
- Point the new node to its successor (next node)
- Point the new node's predecessor (preceding node) to the new node

```
tmp = new Node();  
tmp->data = x;  
tmp->next = current->next;  
current->next = tmp;
```

Inserting a New Node (2)

- Possible cases of `InsertNode`
 1. Insert into an empty list
 2. Insert in front
 3. Insert at back
 4. Insert in middle
- In fact, only need to handle two cases
 - Insert as the first node (Case 1 and Case 2)
 - Insert in the middle or at the end of the list (Case 3 and Case 4)

Inserting a New Node (3)

```
Node* List::InsertNode(int index, double x) {  
    if (index < 0) return NULL;
```

```
    int currIndex = 1;  
    Node* currNode = head;  
    while (currNode && index > currIndex) {  
        currNode = currNode->next;  
        currIndex++;  
    }  
    if (index > 0 && currNode == NULL) return NULL;
```

Try to locate index'th node.
If it doesn't exist, return
NULL

```
    Node* newNode = new Node;  
    newNode->data = x;  
    if (index == 0) {  
        newNode->next = head;  
        head = newNode;  
    }  
    else {  
        newNode->next = currNode->next;  
        currNode->next = newNode;  
    }  
    return newNode;
```

```
}
```

Inserting a New Node (3)

```
Node* List::InsertNode(int index, double x) {  
    if (index < 0) return NULL;
```

```
    int currIndex = 1;  
    Node* currNode = head;  
    while (currNode && index > currIndex) {  
        currNode = currNode->next;  
        currIndex++;  
    }  
    if (index > 0 && currNode == NULL) return NULL;
```

Try to locate index'th node.
If it doesn't exist, return
NULL

```
    Node* newNode = new Node;  
    newNode->data = x;  
    if (index == 0) {  
        newNode->next = head;  
        head = newNode;  
    }  
    else {  
        newNode->next = currNode->next;  
        currNode->next = newNode;  
    }  
    return newNode;
```

Create a new node

```
}
```

Inserting a New Node (3)

```
Node* List::InsertNode(int index, double x) {  
    if (index < 0) return NULL;
```

```
    int currIndex = 1;  
    Node* currNode = head;  
    while (currNode && index > currIndex) {  
        currNode = currNode->next;  
        currIndex++;  
    }  
    if (index > 0 && currNode == NULL) return NULL;
```

Try to locate index'th node.
If it doesn't exist, return
NULL

```
    Node* newNode = new Node;  
    newNode->data = x;  
    if (index == 0) {  
        newNode->next = head;  
        head = newNode;  
    }
```

Create a new node

```
    else {  
        newNode->next = currNode->next;  
        currNode->next = newNode;  
    }  
    return newNode;
```

Insert as first element

```
}
```

Inserting a New Node (3)

```
Node* List::InsertNode(int index, double x) {  
    if (index < 0) return NULL;
```

```
    int currIndex = 1;  
    Node* currNode = head;  
    while (currNode && index > currIndex) {  
        currNode = currNode->next;  
        currIndex++;  
    }  
    if (index > 0 && currNode == NULL) return NULL;
```

```
    Node* newNode = new Node;  
    newNode->data = x;  
    if (index == 0) {  
        newNode->next = head;  
        head = newNode;  
    }
```

```
    else {  
        newNode->next = currNode->next;  
        currNode->next = newNode;  
    }  
    return newNode;
```

```
}
```

Try to locate index'th node.
If it doesn't exist, return
NULL

Create a new node

Insert after currNode

Finding a Node

- **int FindNode(double x)**
 - Search for a node with the value equal to x in the list
 - If such a node is found
 - Return its position
 - Otherwise, return 0

```
int List::FindNode(double x) {  
    Node* currNode = head;  
    int currIndex = 1;  
    while (currNode && currNode->data != x) {  
        currNode = currNode->next;  
        currIndex++;  
    }  
    if (currNode) return currIndex;  
  
    return 0;  
}
```

Deleting a Node – Example (1)

- Deleting item A1 from the list

Deleting a Node – Example (2)

- Deleting item A1 from the list

```
current->next = current->next->next;
```

Deleting a Node – Example (3)

- Deleting item A1 from the list

Deleting a Node – Example (4)

- Deleting item A1 from the list

```
Node *deletedNode = current->next;  
current->next = current->next->next;  
delete deletedNode;
```

Deleting a Node

- **int DeleteNode(double x)**
 - Delete a node with the value equal to x from the list
 - If such a node is found return its position
 - Otherwise, return 0
- **Steps**
 - Find the desirable node (similar to FindNode)
 - Release the memory occupied by the found node
 - Set the pointer of the predecessor of the found node to the successor of the found node
- Like InsertNode, there are **two special cases**
 - Delete first node
 - Delete the node in middle or at the end of the list

Deleting a Node – Implementation (1)

```
int List::DeleteNode(double x) {  
    Node* prevNode    = NULL;  
    Node* currNode     = head;  
    int currIndex      = 1;  
    while (currNode && currNode->data != x) {  
        prevNode      = currNode;  
        currNode      = currNode->next;  
        currIndex++;  
    }  
    if (currNode) {  
        if (prevNode) {  
            prevNode->next    = currNode->next;  
            delete currNode;  
        }  
        else {  
            head = currNode->next;  
            delete currNode;  
        }  
        return currIndex;  
    }  
    return 0;  
}
```

Try to find node with its value equal to x.

Deleting a Node – Implementation (2)

```
int List::DeleteNode(double x) {  
    Node* prevNode    = NULL;  
    Node* currNode     = head;  
    int currIndex      = 1;  
    while (currNode && currNode->data != x) {  
        prevNode      = currNode;  
        currNode       = currNode->next;  
        currIndex++;  
    }  
    if (currNode) {  
        if (prevNode) {  
            prevNode->next    = currNode->next;  
            delete currNode;  
        }  
        else {  
            head = currNode->next;  
            delete currNode;  
        }  
        return currIndex;  
    }  
    return 0;  
}
```

Deleting a Node – Implementation (3)

```
int List::DeleteNode(double x) {  
    Node* prevNode    = NULL;  
    Node* currNode     = head;  
    int currIndex      = 1;  
    while (currNode && currNode->data != x) {  
        prevNode      = currNode;  
        currNode       = currNode->next;  
        currIndex++;  
    }  
    if (currNode) {  
        if (prevNode) {  
            prevNode->next = currNode->next;  
            delete currNode;  
        }  
        else {  
            head = currNode->next;  
            delete currNode;  
        }  
    }  
    return currIndex;  
}  
return 0;  
}
```

10-Link Lists

Printing All The Elements

- **void DisplayList(void)**
 - Print the data of all the elements
 - Print the number of the nodes in the list

```
void List::DisplayList()
{
    int num    = 0;
    Node* currNode = head;
    while (currNode != NULL){
        cout << currNode->data << endl;
        currNode = currNode->next;
        num++;
    }
    cout << "Number of nodes in the list: " << num << endl;
}
```

Destroying The List

- `~List(void)`
 - Use the destructor to release all the memory used by the list
 - Step through the list and delete each node one by one

```
List::~~List(void) {  
    Node* currNode = head;  
    Node* nextNode = NULL;  
    while (currNode != NULL)  
    {  
        nextNode = currNode->next;  
        delete currNode; // destroy the current node  
        currNode = nextNode;  
    }  
}
```

Using List (1)

```
int main(void)
{
    List list;
    list.InsertNode(0, 7.0);    // successful
    list.InsertNode(1, 5.0);    // successful
    list.InsertNode(-1, 5.0);   // unsuccessful
    list.InsertNode(0, 6.0);    // successful
    list.InsertNode(8, 4.0);    // unsuccessful
    // print all the elements
    list.DisplayList();

    return 0;
}
```

Output:

6

7

5

Number of nodes in the list: 3

Using List (2)

```
int main(void)
{
    List list;
    list.InsertNode(0, 7.0);    // successful
    list.InsertNode(1, 5.0);    // successful
    list.InsertNode(-1, 5.0);   // unsuccessful
    list.InsertNode(0, 6.0);    // successful
    list.InsertNode(8, 4.0);    // unsuccessful
    // print all the elements
    list.DisplayList();
    if(list.FindNode(5.0) > 0)  cout << "5.0 found" << endl;
    else                        cout << "5.0 not found" << endl;
    if(list.FindNode(4.5) > 0)  cout << "4.5 found" << endl;
    else                        cout << "4.5 not found" << endl;

    return 0;
}
```

Output:

6

7

5

Number of nodes in the list: 3

5.0 found

4.5 not found

Using List

```
int main(void)
{
    List list;
    list.InsertNode(0, 7.0);
    list.InsertNode(1, 5.0);
    list.InsertNode(-1, 5.0);
    list.InsertNode(0, 6.0);
    list.InsertNode(8, 4.0);
    // print all the elements
    list.DisplayList();
    if(list.FindNode(5.0) > 0)
    else
    if(list.FindNode(4.5) > 0)
    else
        list.DeleteNode(7.0);
    list.DisplayList();
    return 0;
}
```

```
// successful
// successful
// unsuccessful
// successful
// unsuccessful
```

```
cout << "5.0 found" << endl;
cout << "5.0 not found" << endl;
cout << "4.5 found" << endl;
cout << "4.5 not found" << endl;
```

Output:

6

7

5

Number of nodes in the list: 3

5.0 found

4.5 not found

6

5

Number of nodes in the list: 2

Any Question So Far?
