

LR(0) Parsing:

- * Shift - Shift conflict : combine both items
- * Shift - Reduce conflict : cannot be resolved, we make SLR(1) for it.
- + Reduce - Reduce

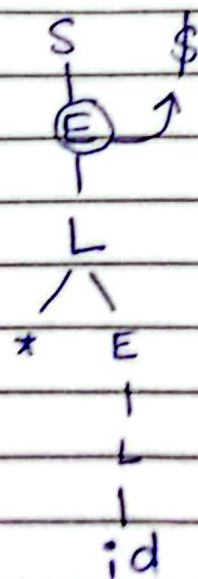

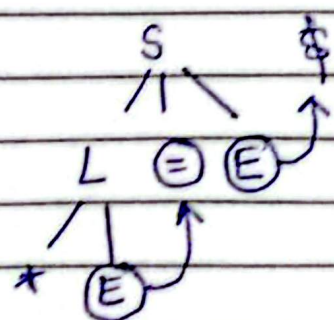

SLR(1) Parsing:

- * Shift - Reduce conflict: Solved by follow sets
- + Reduce - Reduce

* However, follow sets do not care about contexts.

e.g.
 $S \rightarrow L = E \mid E$
 $L \rightarrow * E \mid id$
 $E \rightarrow L$

Follow: $E = \{ \$, = \}$
 $S = \{ \$ \}$
 $L = \{ \$, = \}$

no. = but follow E contain equal.

For $S \rightarrow E$ move, there
 $E \rightarrow L$
 shouldn't be an entry under "=".

LR(1) Parsing:

- * Solves SLR(1) issue, keeps follow with each item
- * But too many rows in parse table
memory issue

LALR(1) Parsing:

- * Reduces states in LR(1) dfa.
