CS-4031 Compiler Construction

Quiz # 1 [15 marks]

Section: _____

Time = 10 minutes
26/01/2026

Name: _____
Roll No: _____

Mark the following statements as either True or False. [CLO-1]

1. A compiler may generate intermediate files that are not directly executable by the CPU.
2. A program translated by a compiler cannot be executed unless it is linked.
3. Interpreters always execute programs faster than compilers because they avoid compilation time.
4. A syntax-correct program is guaranteed to produce correct output.
5. Machine language programs do not require any translation before execution.
6. Assembly language is considered a low-level language because it closely reflects hardware instructions.
7. Portability of a program depends only on the programming language used.
8. A compiler checks the entire program for errors before any instruction is executed.
9. An interpreter may execute some parts of a program even if errors exist later in the code.
10. High-level languages completely eliminate the need to understand hardware details.
11. A single high-level language statement may result in zero machine instructions.
12. Object code produced on one machine can always run on another machine with the same operating system.
13. The purpose of a linker is limited to combining multiple source files.
14. A compiled program requires the compiler to be present during execution.
15. Machine-dependent programs are generally less portable than machine-independent programs.
