CS-4031 Compiler Construction

Quiz # 1 [15 marks]

Section: _____

Time = 10 minutes

26/01/2026

Name: _____

Roll No: _____

Mark the following statements as either True or False. [CLO-1]

1. Logical errors are harder to detect automatically than syntax errors.
2. Assembly language programs are easier to modify than high-level language programs.
3. Translation and execution are always separate steps in program execution.
4. Interpreted languages do not generate any form of translated code.
5. A compiler can successfully compile a program that produces incorrect results.
6. Using a high-level language generally reduces development time compared to low-level languages.
7. A programming language closer to hardware offers less control over system resources.
8. A source program written once can be executed on multiple platforms without change.
9. Faster execution speed is the primary goal of using an interpreter.
10. A compiler improves runtime performance at the cost of additional translation time.
11. Assembly language programs are typically longer than equivalent high-level language programs.
12. Execution of a compiled program begins only after successful translation of the entire program.
13. Errors related to program logic are usually detected during compilation.
14. The same high-level program can produce different executable files on different machines.
15. High-level languages trade hardware control for ease of programming.
