CS-4031 Compiler Construction

Quiz # 1 [15 marks]

Section: _____

Time = 10 minutes
27/01/2026

Name: _____
Roll No: _____

Mark the following statements as either True or False. [CLO-1]

1. A compiler can successfully translate a program that produces incorrect output.
2. Lexical analysis must be completed before syntax analysis can begin.
3. A program written in a high-level language may generate different executables on different machines.
4. One-pass compilers generally impose more restrictions on the source language than multi-pass compilers.
5. Assembly language programs require an assembler before they can be executed.
6. Intermediate representations improve portability of compilers.
7. A compiled program requires the compiler to be present during execution.
8. Semantic errors can exist even when syntax analysis is successful.
9. The back end of a compiler depends on the target architecture.
10. A one-pass compiler reads the source program only once and therefore cannot support forward references.
11. Interpreters perform translation and execution in an interleaved manner.
12. Object code generated on one machine can always execute on another machine running the same operating system.
13. Code optimization may change the result produced by a program.
14. Two-pass compilation generally requires more memory than one-pass compilation.
15. Symbol tables are used to store information about identifiers such as name, type, and scope.
