CS-4031 Compiler Construction

Quiz # 1 [15 marks]

Section: _____

Time = 10 minutes
27/01/2026

Name: _____
Roll No: _____

Mark the following statements as either True or False. [CLO-1]

1. Machine language programs require translation before they can be executed.
2. The front end of a compiler is mostly independent of the target machine.
3. A compiler checks the entire source program for errors before execution begins.
4. Lexical errors are detected before semantic errors.
5. A linker's role is limited to merging multiple source files into a single file.
6. Two-pass compilers may use information collected in the first pass to resolve references in the second pass.
7. High-level languages trade fine-grained hardware control for ease of programming.
8. Assembly language is considered a low-level language because it closely maps to machine instructions.
9. Portability and execution efficiency are often competing goals in language design.
10. One-pass compilers generally impose more restrictions on the source language than multi-pass compilers.
11. A one-pass compiler cannot generate object code.
12. Phases of a compiler must always be executed strictly one after another with no overlap.
13. An interpreter usually provides better error localization than a compiler.
14. A syntax-correct program is guaranteed to be semantically correct.
15. Object code generated on one machine can always execute on another machine running the same operating system.
